For a long-life (in an aircraft frame of reference), naturally-aspirated, SI (spark ignition) gasoline-fueled, two-valve-per-

cylinder, pushrod engine, a BMEP over 204 PSI (14 bar, torque ratio of 1.35) is quite difficult to achieve and requires a serious development program and very specialized components.

Diesel fuel has not always been used on diesel engines. Jet
aircraft operate on fuels known as Jet-A JP-8, and others. All of
these fuels are basically kerosine, the most basic petroleum
distillate fuel. Diesel fuel has been substituted for jet fuel in a
pinch, and is a point for debate among military scholars and

Diesel In The Sky: Aviation And The Diesel Engine

A diesel cycle engine is designed for continuous high stress,
making it suitable for aviation applications. Also by design, a Jet-
A engine cannot operate too lean. Self ignition means no danger
of detonation, since fuel is not introduced until the optimal
moment of combustion. The CD-300 is a geared, liquid-cooled
and turbo-charged engine.

The IBC concept was proposed for gas turbines at least as early as the 1980s and was examined for application in adiabatic diesel engines in 1985 [3885][3886]. More recent work has considered its application to extreme downsized SI engines with a maximum BMEP above 32 bar [3884][3887]. For the extreme downsized engine work, a BSFC benefit as ...
