**Boiler Tubes Failure Causes And Symptoms:** Aggressive localized boiler tube corrosion and loss of tube wall. Pits can act as stress-concentration sites which can be initiation points for stress-related corrosion mechanisms. Causes: Oxygen pitting occurs with the presence of excessive oxygen in boiler water. It can occur during operation as a result of in-leakage of air at pumps, or failure in operation of preboiler water ...

## **Finding the Root Cause of Boiler Tube Failures**

The environmental conditions within the boiler can be highly aggressive and alter the microstructure of tubing. Stresses caused by external loads, or induced by cold forming operations, uneven cooling or welding, may substantially lower the resistance of tubing to attack by certain corrosive media.

In water tube boilers thermal fatigue can occur when there is frequent wetting of a hot surface such as is caused by an ill placed and leaking valve dripping internally into a hot steam line. Such failure of a steam line could have very serious consequences. Thermal fatigue cracks can be similar to corrosion fatigue and the two are often confused.
