Boundary Value Problem Solved In

In mathematics, in the field of differential equations, a boundary value problem is a differential equation together with a set of additional constraints, called the boundary conditions. A solution to a boundary value

A boundary value problem is a solution to the differential equation which also satisfies the boundary conditions. Boundary value problems arise in several branches of physics as any physical differential equation will have them.

Problems involving the wave equation, such as the determination of the normal modes of a vibrating string, are boundary value problems.

Note that this kind of behavior is not always unpredictable however. If we use the conditions $y(0) = y(0)$ and $y(2\pi) = y(2\pi)$ the only way we'll ever get a solution to the boundary value problem is if we have, $y(0) = a$ $y(2\pi) = a$ $y(0) = a$ $y(2\pi) = a$. for any value of a .
