the II B -VI group of semiconductors whose diverse optical and electrical properties make them excellent candidates for optoelectronic and spintronic applications. A large portion of their properties is directly related to the interaction of the localized semicore d electrons with the valence sp electrons.

••• Hetero And Nano Structures Crystal Growth Surfaces

An overview on the defect knowledge in IV-VI (PbTe), II-VI (CdTe) and III-V (GaAs, InP) semiconductor compound crystals in dependence on non-stoichiometric growth conditions from the melt is given. The treatment starts with the today's informations about the phase relations, i.e. the
