Enteral feeding formulae are about 70-80% water and the remainder of the volume consists of solids that are not used as fluid by the body. For accurate calculation of fluid input (eg to meet requirements, or for fluid restrictions), it is important to use the formula's actual water content, not the total volume of formula being given.

Most enteral feed is given into the stomach to allow the use of hypertonic feeds, higher feeding rates, and bolus feeding. Fine bore 5–8 French gauge NG tubes are now used unless there is a need for stomach aspiration, or administration of high fibre feeds or drugs via the tube. 25 Large bore PVC tubes should be avoided as they irritate the nose and oesophagus and increase the risks of gastric reflux and aspiration.

Hospital malnutrition, hyperglycemia and insulin therapy are three closely related variables that affect the quality of life and the result of treatment in the hospitalized person. They have the characteristic of influencing each other: a bad glycometabolic control worsens the state of nutrition and, on the other hand, malnutrition can cause hyperglycemia (1,2). Inadequate insulin therapy does ...
