In 1859 Bernhard Riemann, a shy German mathematician, wrote an eight-page article, suggesting an answer to a problem that had long puzzled mathematicians. For the next 150 years, the world's mathematicians have longed to confirm the Riemann hypothesis. So great is the interest in its solution that in 2001, an American ...

The value at zero allows us to determine the constant A as $7, A(1)(2)(3)(5)$ so our polynomial can be written as $(x-1)(x-2)(x-3)(x-5) \times x \times x \times p(x)$ $7 \ 7 \ 1 \ 1 \ 1 \ 1$. $(1)(2)(3)(5) \ 1 \ 2 \ 3 \ 5$ It should be clear that this process can be generalized to a polynomial with an arbitrary number of simple (multiplicity 1) zeros as n

The zeros for $l = 1, 2, \dots, 5$ of (s) are shown in Table 4.2. The real parts are all equal to $1/2$. In fact, more than 100 years ago Riemann enunciated his famous hypothesis that all complex zeros of (s) have real part $1/2$.
