In conjunction with algebra, topology forms a general foundation of mathematics, and promotes its unity. The object of topology is to study those properties of figures, and their mutual disposition, that are preserved under homeomorphisms (cf. Homeomorphism), i.e. one-to-one mappings that are continuous together with their inverses.

This is a glossary of some terms used in the branch of mathematics known as topology. Although there is no absolute distinction between different areas of topology, the focus here is on general topology. The following definitions are also fundamental to algebraic topology, differential topology and geometric topology.

During the 19th century two distinct movements developed that would ultimately produce the sibling specializations of algebraic topology and general topology. The first was characterized by attempts to understand the topological aspects of surfacelike objects that arise by combining elementary shapes, such as polygons or polyhedra.
