Assuming the paper to be porous media like a sponge, we analyzed the moisture travel based on the water-vapor-pressure difference inside the paper, and moisture diffusion, taking into account temperature at the time of fusing and paper properties. From this analysis result, we can predict paper curl at the time of heating.

Paper Curl Analysis Technology | Global | Ricoh

CURL Curl is generally considered to be the tendency of paper or paperboard to curl or roll up in the cross machine direction, usually in response to changes in relative humidity (RH). This is often referred to as “CD curl”. Machine direction curl (MD) is often called “roll set curl”.

Curl control on a fourdrinier machine involves adjusting the stock velocity relative to that of the wire in increments of 10-20 fpm. We wish to minimize differences in wire versus fiber orientation between wire and felt sides. A measurement that can be used to make comparisons is the hot bend curl test (see figure 3) Figure 3. copy papers is measured using a sheet splitting method and hygroexpansivity is determined using an ultrasonic sheet tester. Curl behavior of the paper is well described by the model equations. In particular it can be explained, why the CD curl and the diagonal curl in the examined papers show great differences.

Paper tends to curl most in the direction of the side or surface from which moisture migrates last. Curl problems during use can be expected if the moisture content of the paper does not correspond to the equilibrium humidity condition that will be present when the paper is converted or printed.

Paper curl is caused by an excess amount of moisture in the paper. The first step to ensure less paper curl is to store your paper in a cool, dry area. By doing so, you will reduce the amount of moisture and humidity the paper is exposed to. The next step is to always fan the paper before placing in the machine.

A: Hot-bend curl test Figure 2 illustrates the hot-bend curl test. The aluminum block is heated to 300 [degrees]F [+ or -] 10 [degrees]F, and the paper strip is then held by fingertips and pulled against the heated block for 2 seconds. Curl of the paper sample is measured using a previously described method (6).

If the air is too dry, moisture will be drawn from the surfaces, causing the paper to curl. When humidity is low, a build up of static can occur, causing papers to stick together. Achieving this range of humidity can be difficult, however.
