The Galaxy began forming a little more than 13 billion years ago. Models suggest that the stars in the halo and globular clusters formed first, while the Galaxy was spherical. The gas, somewhat enriched in heavy elements by the first generation of stars, then collapsed from a spherical distribution to a rotating disk-shaped distribution.

What's Creating Galaxy-Spanning Cold Gas Filaments in Galaxy Clusters? Research Points to Burps from Supermassive Black Holes Two Georgia Tech physicists may have come up with an answer for how cold gas filaments can stretch for tens of thousands of light-years from the super hot centers of galaxy clusters.

The diffuse "haze" is emission from gas at a temperature of 10 million K. This hot gas is flowing away from the center out into the rest of the Galaxy. The colors indicate X-ray energy bands: red (low energy), green (medium energy), and blue (high energy). As we approach the center of the Galaxy, we find the supermassive black hole Sagittarius A*.
