The simplest approach to model the dynamic behavior of the soil is the shear beam approach.In this case, an isolated column of soil is modeled as an equivalent beam that can deform only in the shear mode (i.e. without contributions from bending), as shown in Fig.1.If the soil is uniform, the natural frequencies of the system can be determined ...

Dynamic soil properties are more pronounced at or near the soil surface and can be used to evaluate changes and departure from a benchmark or set of reference soil properties. Conceptually, this allows DSPs to be correlated with map unit components used in traditional soil survey (see chapter 4 ).

The study of soil structure ranges from the effects of particle interaction at a scale of nanometers (Quirk, 1994) to the functioning of soil structure profiles at a scale of meters (Miedema et al., 1994a; Fig. 1).The spatial variation of soil structure on farmers' fields (Finke, 1992, 1993) and in catenary sequences in the landscape extends the scale to kilometers.
