SAFETY VALVES IN SERIES 3060 tightness on the valve seat. The gasket is made from PTFE (Polytetrafluorethylene), a material that, during the valve's estimated service life, maintains good strength and does not cause the shutter to stick on the seat. The shutter is properly guided in the body and the guide action cannot fail.

Introduction A pressure relief valve is a safety device designed to protect a pressurized vessel or system during an over- pressure event. An overpressure event refers to any condition which would cause pressure in a vessel or system to increase beyond the specified design pres- sure or maximum allowable working pressure (MAWP).

Pressure relief valves are mainly used in hydraulic systems to limit the pressure in the system to a specific preset level and when the pressure reaches the safety design limit, the relief valve responds by releasing the excess flow from an auxiliary passage from the system back to the tank in order to prevent equipment failure.

Difference Between Relief Valve and Safety Valve ...

A safety valve is a valve that acts as a fail-safe. An example of safety valve is a pressure relief valve (PRV), which automatically releases a substance from a boiler, pressure vessel, or other system, when the pressure or temperature exceeds preset limits. Pilot-operated relief valves are a specialized type of pressure safety valve.
