A Framework for K-12 Science Education

Practices, Crosscutting Concepts, and Core Ideas

National Academies Press **Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the field. A Framework for K-12 Science Education outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.**

The Global Politics of Science and Technology - Vol. 1

Concepts from International Relations and Other Disciplines

Springer **An increasing number of scholars have begun to see science and technology as relevant issues in International Relations (IR), acknowledging the impact of material elements, technical instruments, and scientific practices on international security, statehood, and global governance. This two-volume collection brings the debate about science and technology to the center of International Relations. It shows how integrating science and technology translates into novel analytical frameworks, conceptual approaches and empirical puzzles, and thereby offers a state-of-the-art review of various methodological and theoretical ways in which sciences and technologies matter for the study of international affairs and world politics. The authors not only offer a set of practical examples of research frameworks for experts and students alike, but also propose a conceptual space for interdisciplinary learning in order to improve our understanding of the global politics of science and technology. This first volume summarizes various time-tested approaches for studying the global politics of science and technology from an IR perspective. It also provides empirical, theoretical, and conceptual interventions from geography, history, innovation studies, and science and technology studies that indicate ways to enhance and rearticulate IR approaches. In addition, several interviews advance possibilities of multi-disciplinary collaboration.**

Lifelong Learning

Concepts, Benefits and Challenges

Nova Publishers **Since the second half of the twentieth century, Lifelong Learning (LLL) has become a fashionable mantra, a political slogan, and an active tool to stimulate economic growth and foster social cohesion. However, where does its dominance lie? According to Rogers (2006) LLLs main success is that it has predominantly achieved to become mainstream, as it provided a convincing rationale for embracing the natural learning process which continues unifying education into a common process, challenging the distinctiveness of educational sectors, and acknowledging that learning takes place in different contexts, thus relocating learning in both formal and informal settings. Thence, recent conceptualisations of LLL, under the universally rising awareness that learning is but an integral part of our everyday lives, and tends to continually expand, accommodating the multitude of types, sites, practices or modes of learning, both intentional and incidental. On these grounds, this book has been conceived to explore contemporary concepts, practices, benefits and challenges associated with LLL at formal, non-formal and informal levels. How LLL is currently perceived? What are the "regimes of truth" LLL is informed by? What are the influences, constraints and impact of the diverse LLL sites and practices? What are the effects on learning and learning outcomes? What are the implications for policy making, as well as for the development and implementation of LLL initiatives? These are some indicative inquiries which guided the structure and the selection of themes in the present volume. Furthermore there has also been an effort to reach for multiple perspectives from different nations around the globe. The book is structured around two principal axes (theory-based and research-based studies) so as to provide in depth insights into debates and challenges that revolve around LLL, whilst combining theory and empirical research in a dialectical fashion. It may thus be of particular interest to a wide range of audiences -- such as researchers, policy makers and practitioners -- who wish to get an international perspective in LLL. This occurs through chapters that prompt reflection, showcase innovative professional practices and provide impressive scopes of field research.**

Microservices

Science and Engineering

Springer Nature **This book describes in contributions by scientists and practitioners the development of scientific concepts, technologies, engineering techniques and tools for a service-based society. The focus is on microservices, i.e cohesive, independent processes deployed in isolation and equipped with dedicated memory persistence tools, which interact via messages. The book is structured in six parts. Part 1 “Opening” analyzes the new (and old) challenges including service design and specification, data integrity, and consistency management and provides the introductory information needed to successfully digest the remaining parts. Part 2 “Migration” discusses the issue of migration from monoliths to microservices and their loosely coupled architecture. Part 3 “Modeling” introduces a catalog and a taxonomy of the most common microservices anti-patterns and identifies common problems. It also explains the concept of RESTful conversations and presents insights from studying and developing two further modeling approaches. Next , Part 4 is dedicated to various aspects of “Development and Deployment”. Part 5 then covers “Applications” of microservices, presenting case studies from Industry 4.0, Netflix, and customized SaaS examples. Eventually, Part 6 focuses on “Education” and reports on experiences made in special programs, both at academic level as a master program course and for practitioners in an industrial training. As only a joint effort between academia and industry can lead to the release of modern paradigm-based programming languages, and subsequently to the deployment of robust and scalable software systems, the book mainly targets researchers in academia and industry who develop tools and applications for microservices.**

At the Crossroads: Lessons and Challenges in Computational Social Science

Frontiers Media SA **The interest of physicists in economic and social questions is not new: for over four decades, we have witnessed the emergence of what is called nowadays “sociophysics” and “econophysics”, vigorous and challenging areas within the wider “Interdisciplinary Physics”. With tools borrowed from Statistical Physics and Complexity, this new area of study have already made important contributions, which in turn have fostered the development of novel theoretical foundations in Social Science and Economics,**

via mathematical approaches, agent-based modelling and numerical simulations. From these foundations, Computational Social Science has grown to incorporate as well the empirical component --aided by the recent data deluge from the Web 2.0 and 3.0--, closing in this way the experiment-theory cycle in the best tradition of Physics.

The Nature of the Chemical Concept

Re-constructing Chemical Knowledge in Teaching and Learning

Royal Society of Chemistry **The features of chemistry that make it such a fascinating and engaging subject to teach also contribute to it being a challenging subject for many learners. Chemistry draws upon a wide range of abstract concepts, which are embedded in a large body of theoretical knowledge. As a science, chemistry offers ideas that are the products of scientists' creative imaginations, and yet which are motivated and constrained by observations of natural phenomena. Chemistry is often discussed and taught largely in terms of non-observable theoretical entities - such as molecules and electrons and orbitals - which probably seem as familiar and real to a chemistry teacher as Bunsen burners: and, yet, comprise a realm as alien and strange to many students as some learners' own alternative conceptions ('misconceptions') may appear to the teacher. All chemistry teachers know that chemistry is a conceptual subject, especially at the upper end of secondary school and at university level, and that some students struggle to understand many chemical ideas. This book offers a step-by-step analysis and discussion of just why some students find chemistry difficult, by examining the nature of chemistry concepts, and how they are communicated and learnt. The book considers the idea of concepts itself; draws upon case studies of how canonical chemical concepts have developed; explores how chemical concepts become represented in curriculum and in classroom teaching; and discusses how conceptual learning and development occurs. This book will be invaluable to anyone interested in teaching and learning and offers guidance to teachers looking to make sense of, and respond to, the challenges of teaching chemistry.**

Concepts and Challenges in Life Science

Communicating Science Effectively

A Research Agenda

National Academies Press **Science and technology are embedded in virtually every aspect of modern life. As a result, people face an increasing need to integrate information from science with their personal values and other considerations as they make important life decisions about medical care, the safety of foods, what to do about climate change, and many other issues. Communicating science effectively, however, is a complex task and an acquired skill. Moreover, the approaches to communicating science that will be most effective for specific audiences and circumstances are not obvious. Fortunately, there is an expanding science base from diverse disciplines that can support science communicators in making these determinations. Communicating Science Effectively offers a research agenda for science communicators and researchers seeking to apply this research and fill gaps in knowledge about how to communicate effectively about science, focusing in particular on issues that are contentious in the public sphere. To inform this research agenda, this publication identifies important influences â€" psychological, economic, political, social, cultural, and media-related â€" on how science related to such issues is understood, perceived, and used.**

Connecting Science, Technology, and Society in the Education of Citizens

Eric Clearinghouse for Social **Designed to help educators address science-related social issues, this publication considers: (1) major challenges associated with science-related social issues; (2) the extent to which these challenges are being met; (3) ways in which educators can improve the education of citizens in science, technology, and social issues; and (4) promising practices that can contribute to building connections between social studies and science curricula. Three challenges outlined in the first of five sections include: (1) informing citizens about complex social issues and decisions, (2) connecting diverse fields of knowledge in school curricula, and (3) resisting antagonists of science and technology. In order to determine the extent to which these challenges are currently being met, the second section examines: goal statements in curriculum reports and major reports in the social studies and the sciences; research findings on student knowledge and attitudes regarding science, technology, and society; and analyses of current curricula and textbooks. The third section describes ways in which "integrative threads" can be used to provide common learning experiences within and between distinct courses in the social studies and sciences. The fourth section presents promising practices that can contribute to this building of connections between social studies and science curricula; the use of "decision trees" and case studies, the use of role play and simulation, and the use of instructional television and microcomputers. Concluding observations in the final section and a bibliography listing over 170 publications conclude the document. (LH)**
