The schools and institutions involved in empirical studies range from elementary through college and include public and private schools, alternative schools for dropouts, and museums. Difference is regarded as a resource for learning and equity issues are examined in terms of race, ethnicity, language

proficiency, designation as special education, and gender. The contexts for research on teaching and learning involve science, mathematics, uses of technology, literacy, and writing comic books. A dual focus addresses research on teaching and learning, and learning to teach in urban schools. Collaborative activities addressed explicitly are teachers and students enacting roles of researchers in their own classrooms, cogenerative dialogues as activities to allow teachers and students to learn about one another's cultures and express their perspectives on their experienced realities and negotiate shared recommendations for changes to enacted curricula. Coteaching is also examined as a means of learning to teach, teaching and learning, and undertaking research. The scholarship presented in the constituent chapters is diverse, reflecting multi-logicality within sociocultural frameworks that include cultural sociology, cultural historical activity theory, prosody, sense of place, and hermeneutic phenomenology. Methodologies employed in the research include narratology, interpretive, reflexive, and authentic inquiry, and multi-level inquiries of video resources combined with interpretive analyses of social artifacts selected from learning environments. This edited volume provides insights into research of places in which social life is enacted as if there were no research being undertaken. The research was intended to improve practice. Teachers and learners, as research participants, were primarily concerned with teaching and learning and, as a consequence, as we learned from research participants were made aware of what we learned—the purpose being to improve learning environments. Accordingly, research designs are contingent on what happens and emergent in that what we learned changed what happened and expanded possibilities to research and learn about transformation through heightening participants' awareness about possibilities for change and developing interventions to improve learning.

In this comprehensive analysis of the social, political, and ethical conflicts surrounding the use of animals in scientific experiments, Barbara Orlans judges both ends of the spectrum in this debate -- unconditional approval or rejection of animal experimentation -- to be untenable. Instead of arguing for either view, she thoughtfully explores the ground between the extremes, and convincingly makes the case for public policy reforms that serve to improve the welfare of laboratory animals without jeopardizing scientific endeavor. This book presents controversial issues in a balanced manner based on careful historical analysis and original research. Different mechanisms of oversight for animal experiments are compared and those that have worked well are identified. This compelling work will be of interest to biomedical scientists, ethicists, animal welfare advocates and other readers concerned with this critical issue.
