Both neurological diseases and neurological manifestations of general diseases and injuries are included in this comprehensive coding tool. The volume is part of a growing family of specialty-based adaptations of ICD-10 which retain the core codes of the parent classification while providing extended detail at the fifth character and beyond. Now in its second edition ICD-NA has been revised to reflect current clinical concepts in the neurosciences as well as the new coding system introduced with ICD-10. The classification was finalized following extensive consultation with numerous professional organizations and international experts thus ensuring the representation of as many viewpoints as are practical and consistent. While remaining directly compatible with ICD-10 ICD-NA offers clinicians and researchers much greater precision allowing them to match an explicit diagnosis with a detailed code at the five- six or seven-character level. In addition a comprehensive alphabetical index and the extensive use of inclusion and exclusion terms provide considerable assistance in finding the correct category for any condition diagnosed. Apart from these opportunities for recording greater diagnostic detail the direct compatibility with ICD-10 facilitates comparisons between statistics compiled according to ICD-NA and national morbidity and mortality statistics compiled according to ICD-10. These features enhance the flexibility of ICD-NA making it suitable for use in morbidity statistics hospital record indexing and epidemiological research by government and other health agencies collecting statistical data under relatively few main headings or by

individual physicians and researchers requiring a convenient tool for indexing their clinical and teaching material in sufficient detail. The revised classification should also facilitate the collection of epidemiological data comparisons of the prevalence of individual neurological diseases and identification of the risk factors for these diseases at both national and international levels. In addition to the detailed tabular list of neurological and related disorders the volume includes an explanation of the basic principles of classification and instructions for coding morphology codes for neoplasms relevant to neurology and neurosurgery and a 90-page index of diagnostic terms given in standard or official nomenclatures together with synonyms and eponyms.

PAEDIATRIC STROKE CODE. FREQUENCY, CLINICAL FEATURES AND FINAL DIAGNOSIS Aim: Our aim is to analyse the frequency, clinical features and final diagnosis of stroke code at paediatric age (from 1 month to 16 years-old) in a stroke centre with a multidisciplinary paediatric stroke management protocol. Material and methods: Retrospective analysis from the emergency calls to the neurology service selecting those activating the paediatric stroke code between January 2014 to March 2018. In-hospital strokes were excluded. Results: We analysed 204 emergency calls from the Paediatric Hospital, which 22 (10,7%) were activated as stroke codes (6 cases per year on average). The diagnosis of stroke was confirmed in 7 (31,8%), with 2 brain haemorrhages (29 %) and 5 cerebral infarctions (71 %). The median door-to-neuroimaging time was 48 minutes (IQR 33, 461) and the median NIHSS was 11 (IQR 3, 13). Two out of 5 ischemic stroke patients were treated with recanalization therapies: 1 patient with intravenous thrombolysis plus mechanical thrombectomy and other with primary mechanical thrombectomy. Fifteen patients were diagnosed with stroke mimics (72,7%), being migraine the most frequent diagnosis with 7 patients (46 %) followed by 2 patients with conversive disorders (13%), 1 patient with epileptic seizure (7%), 1 patient with a brain tumour (7%) and 4 patients with other diagnosis (27%).

CONCLUSIONS: Paediatric stroke code is an uncommon neurological emergency even in a Stroke Center and only one third of them are actually strokes, being the migraine the main stroke mimics. A paediatric stroke code allows the indication of recanalization treatments for properly selected children suffering ischemic stroke.

Neurological Rehabilitation Newnes Neurological Rehabilitation is the latest volume in the definitive Handbook of Clinical Neurology series. It is the first time that this increasingly important subject has been included in the series and this reflects the growing interest and quality of scientific data on topics around neural recovery and the practical applications of new research. The volume will appeal to clinicians from both neurological and rehabilitation backgrounds and contains topics of interest to all members of the multidisciplinary clinical team as well as the neuroscience community. The volume is divided into five key sections. The first is a summary of current research on neural repair, recovery and plasticity. The authors have kept the topics readable for a non-scientific audience and focused on the aspects of basic neuroscience that should be most relevant to clinical practice. The next section covers the basic principles of neurorehabilitation, including excellent chapters on learning and skill acquisition, outcome measurement and functional neuroimaging. The key clinical section comes next and includes updates and reviews on the management of the main neurological disabling physical problems, such as spasticity, pain, sexual functioning and dysphagia. Cognitive, emotional and behavioural problems are just as important and are covered in the next section, with excellent chapters, for example, on memory and management of executive dysfunction. The final part draws the sections on symptom management together by discussing the individual diseases that are most commonly seen in neurorehabilitation and providing an overview of the management of the disability associated with those disorders. The volume is a definitive review of current neurorehabilitation practice and will be valuable to a wide range of clinicians and scientists working in this rapidly developing field. A volume in the Handbook of Clinical Neurology series, which has an unparalleled reputation as the world's most comprehensive source of information in neurology

International list of contributors including the leading workers in the field Describes the advances which have occurred in clinical neurology and the neurosciences, their impact on the understanding of neurological disorders and on patient care

The criteria cover a wide spectrum of neurological conditions whose diagnosis does not depend solely on histopathology (e.g., brain tumors), including cerebrovascular diseases, dementias and behavioral disorders, demyelinating disorders, and disorders of consciousness and brain death. Standardized criteria are also provided for epilepsy, genetic syndromes, headache, immune-based disorders, infectious diseases, movement disorders, neuromuscular disorders, and sleep disorders. A dazzling array of tables summarizes useful information on both common and uncommon neurological conditions, including many genetic and pediatric neurological disorders. United States Code Containing the General and Permanent Laws of the United States, Enacted Through the 112th Congress (ending January 2, 2013, the Last Law of which was Signed on January 15, 2013) "The United States Code is the official codification of the general and permanent laws of the United States of America. The Code was first published in 1926, and a new edition of the code has been published every six years since 1934. The 2012 edition of the Code incorporates laws enacted through the One Hundred Twelfth Congress, Second Session, the last of which was signed by the President on January 15, 2013. It does not include laws of the One Hundred Thirteenth Congress, First Session, enacted between January 2, 2013, the date it convened, and January 15, 2013. By statutory authority this edition may be cited "U.S.C. 2012 ed." As adopted in 1926, the Code established prima facie the general and permanent laws of the United States. The underlying statutes reprinted in the Code remained in effect and controlled over the Code in case of any discrepancy. In 1947, Congress began enacting individual titles of the Code into positive law. When a title is enacted into positive law, the underlying statutes are repealed and the title then becomes legal evidence of the law. Currently, 26 of the 51 titles in the Code have been so enacted. These are identified in the table of titles near the beginning of each volume. The Law Revision Counsel of the House of Representatives continues to prepare legislation pursuant to 2 U.S.C. 285b to enact the remainder of the Code, on a title-by-title basis, into positive law. The 2012 edition of the Code was prepared and published under the supervision of Ralph V. Seep, Law Revision Counsel. Grateful acknowledgment is made of the contributions by all who helped in this work, particularly the staffs of the Office of the Law Revision Counsel and the Government Printing Office"--Preface.

Services for people with neurological conditions *Department of Health The Stationery Office* Since 2005, when the Department of Health introduced its National Service Framework for Long-term Conditions, people with neurological conditions have had better access to health services; but key indicators of quality - such as the rate of

emergency hospital readmissions - have worsened. The Department does not know what the Framework and additional spending of nearly 40 per cent over four years have achieved. The Framework was designed to improve care for people with neurological conditions but progress in implementing it has been poor. Access to health services for people with long-term neurological conditions, such as Parkinson's disease, multiple sclerosis and motor neurone disease, has improved and waiting times for inpatient and outpatient neurology have decreased since 2007. The number of elective neurological operations performed has also increased. However, the rate of emergency admissions to hospital has increased significantly and there is large variation in emergency admission rates between Primary Care Trusts. Access to services for patients also varies significantly depending on where they live. Many patients, following their diagnosis, are not given information on their condition, about local services or on available support. Ongoing care is fragmented and poorly coordinated and there is a pattern of patients being referred to hospital for treatment, then discharged and then referred to hospital again. The NAO also found that there is poor coordination between health and social services. The number of adults with a physical disability receiving social services has fallen since 2005-06, because fewer people are now eligible for these services
